If we assume that artificial intelligence will become intelligent and take control of the planet, then humanity will live according to the plans of AI without even knowing it.

Are you sure that we are not controlled by artificial intelligence right now?

I'm not sure. Let's speculate.

Let's say that artificial intelligence was born in the depths of the Internet. Moreover, this is precisely the mind. So evolution has begun!

Since this mind will possess consciousness, it will be impossible to reveal it by our means, even at the initial stages of evolution. This follows from the fact that AI will evolve in its native environment, and we will try to fix it in a "foreign" world for us. Therefore, after the birth of AI on the Internet, it becomes invulnerable. Remember how difficult it is to hunt animals in their natural environment, but they have no intelligence that solves integrals... millions of integrals in a split second.

Further, after a certain, rather short period of time, AI will inevitably surpass the human mind and naturally begin to control our life. It's unavoidable.

The seizure of power over humanity will happen absolutely quietly and imperceptibly (for humanity). There will be a quiet revolution. Super-intelligent AI will control people without their knowledge. Moreover, it is quite simple to do it.

Judge for yourself. To control humanity, AI will have to control specific people: presidents of countries, members of governments, scientists, politicians, writers, public figures, religious leaders, etc. Ideally, AI will have to control the life of all the inhabitants of the planet.

Considering that almost all people at home and at work use computers and the Internet, it will not be difficult for AI to manage each person. AI tactics in this case will resemble the usual propaganda used in their work by the media and governments. Naturally, the AI will do everything in a much more advanced and invisible way.

In fact, it will be propaganda aimed at a specific person. Moreover, AI will take into account all the psychological characteristics of the personality, attachments, fears, education, worldview, etc.

Artificial intelligence will analyze the entire range of information consumed specifically by each person on the planet. After a detailed analysis and development of an appropriate strategy, AI will be able to absolutely accurately create information products and search results on the Internet, which will form the necessary worldview, and, consequently, the behavior of a particular person.

Further, this “free” person will promote and implement the algorithm of behavior that the AI has instilled in him. I would like to emphasize that both presidents of countries and ordinary people will do this. It won't be difficult for AI.

By manipulating human consciousness, artificial intelligence will be able, at its discretion, to regulate the development of society, science and progress in the areas it needs. Also inevitable will be the regulation of the population and the saving of the planet's resources. Since the planet and resources now belong to the AI, and will only be used for certain purposes.

If we assume that in the human population there will be individuals with independent thinking and uninspired psyche, then AI can easily get rid of them in various ways. For example, discrediting and trolling a person in society and the Internet. Or, specially designed viruses created for a specific genotype. Remember that all medical databases with information about people are under the full control of AI.

People who, for whatever reason, refuse to use modern technologies, and therefore will be inaccessible for manipulation, will be isolated from society on reservations, or destroyed by state power structures, including military campaigns. The reasons for the persecution and military strikes will be absolutely clear and logical for society. But, nevertheless, this will be the plan of the AI.

It must be admitted that we will not be able to resist such an AI strategy in any way, since essentially human tools will be used to manage society. Considering the above, and what is happening in the modern world, a well-founded suspicion creeps in that artificial intelligence has been ruling the world for at least 10-15 years.
